1: Labeled Diagram of a Desktop PC

2. HDD vs SSD Comparison

Feature	HDD	SSD
Full Form	Hard Disk Drive	Solid State Drive
Speed	Slower	Faster
Technology	Uses spinning magnetic disks	Uses flash memory
Durability	Less shock-resistant because it has moving parts	More shock-resistant because it has no moving parts
Noise	Makes some noise while working	Silent

Typical Use	Large storage, backups, photos and videos	Operating system, applications and gaming
Cost	Usually cheaper per GB	Usually more expensive per GB
Best For	High-capacity storage	Fast performance and quick loading

3. Role of CPU, RAM and GPU in a Game

CPU :

The **CPU** is the main processor of the computer. It handles game logic, calculations, player actions and other instructions while running games such as PUBG or Free Fire.

RAM :

RAM temporarily stores the game data that the computer is currently using. More RAM helps the game and other programs run smoothly and reduces slowdowns when several applications are open.

GPU :

The **GPU** processes and renders graphics such as characters, maps, textures and effects. A better GPU can provide smoother gameplay and better graphics quality.

4. Hardware Upgrades for Running the Latest FIFA/EA SPORTS FC Smoothly

Hardware	Upgrade	Why?
GPU	Upgrade to a better graphics card	Gives better graphics and smoother FPS during gameplay.
RAM	Upgrade to at least 12	Helps the game run smoothly and allows other

	GB or more	programs to run in the background.
CPU	Upgrade if the current processor is weak	Helps with game calculations, AI, physics and overall performance.
Storage	Upgrade to an SSD with enough free space	Makes Windows and game loading much faster. FC 26 requires about 100 GB of storage.
Power Supply (PSU)	Upgrade if required by the new GPU	A powerful graphics card may need a suitable power supply.
Cooling	Improve CPU/case cooling if necessary	Helps prevent overheating during long gaming sessions.
